WEB-BASED INTERFACE DESIGN

LAB MODULE 3

HTML5

NAME:

NURSYAHEERA BINTI MOHD HISHAM

NO. MATRIC:

S76276

LECTURER'S NAME :

ASSOC. PROF. TS. DR. WAN NURAL JAWAHIR HJ WAN YUSSOF

LAB MODERATOR:

PN, WAN FATIN FATIAH BINTI YAHYA

DATE:

5 NOVEMBER 2025

LAB MODULE 3: HTML5

3.1 Objectives

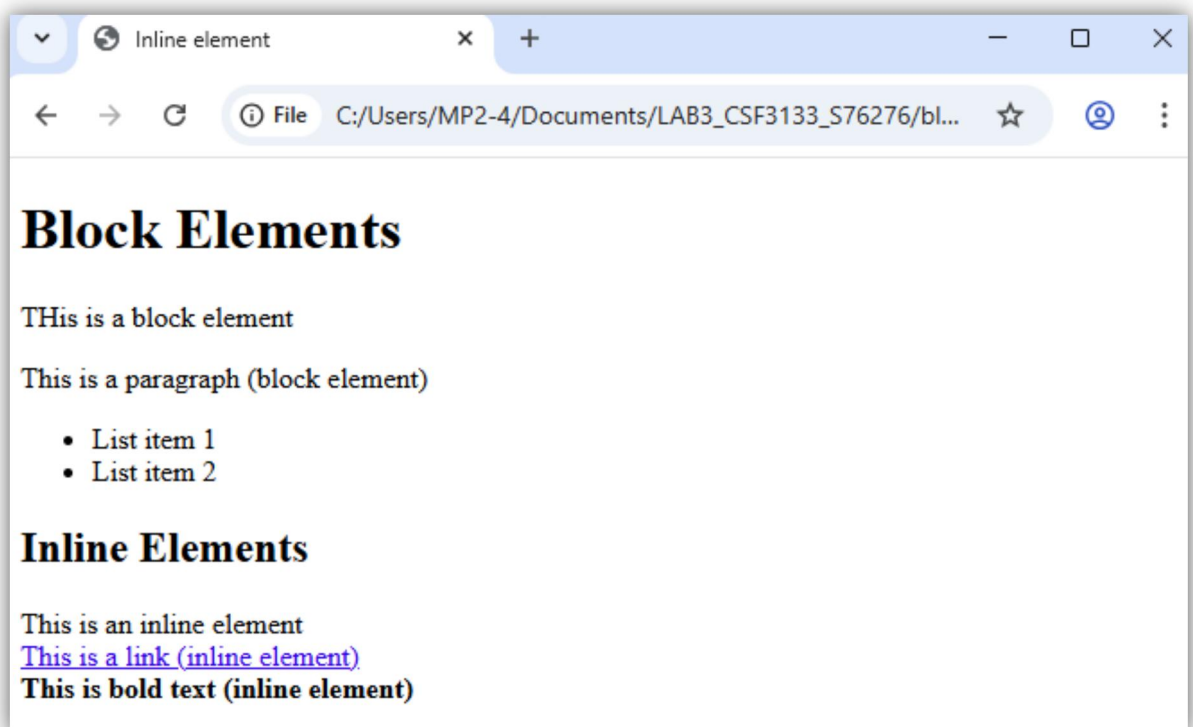

By the end of this lab, you will have a basic understanding of:

1. Differentiate between block and inline element.
2. Use <div> for better web page organization.
3. Apply HTML entities to display special characters.
4. Implement various HTML5 form elements.
5. Utilize the <output> element to display dynamic results.

3.2 Block and Inline Elements

1. The text editor was opened and a new HTML file named block.html was created. Inside the <body>, one section containing examples of block elements was added.
2. Below the section for block elements, a second section containing examples of inline elements was added.

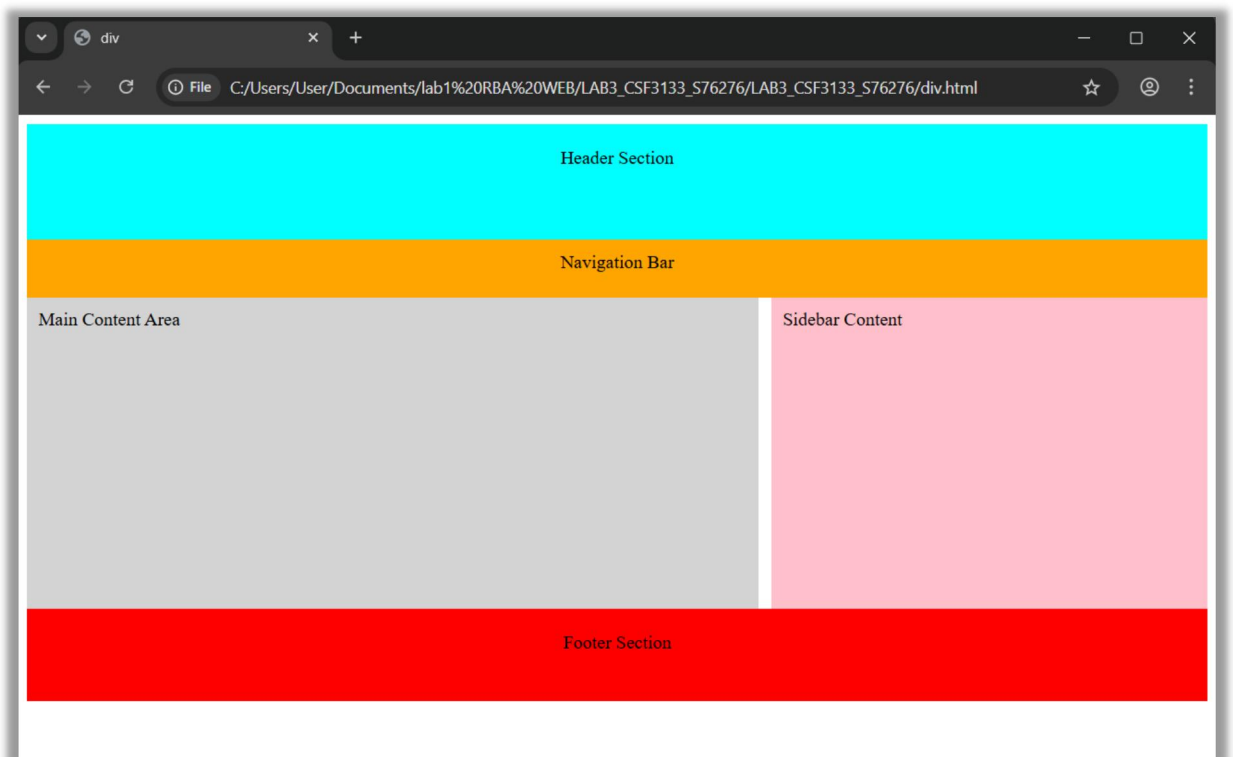

Output:

3.3 Using <div> to Organize Content

1. The new HTML file was opened and named div.html
2. Inside <body>, five separate <div> elements were used to structure the webpage into sections
3. The file div.html was saved and opened in a browser to display the structured sections. Following this, the style attributes such as background-color, height, width, text-align, and float were modified, and the resulting visual changes were noted to understand the effect of each attribute.

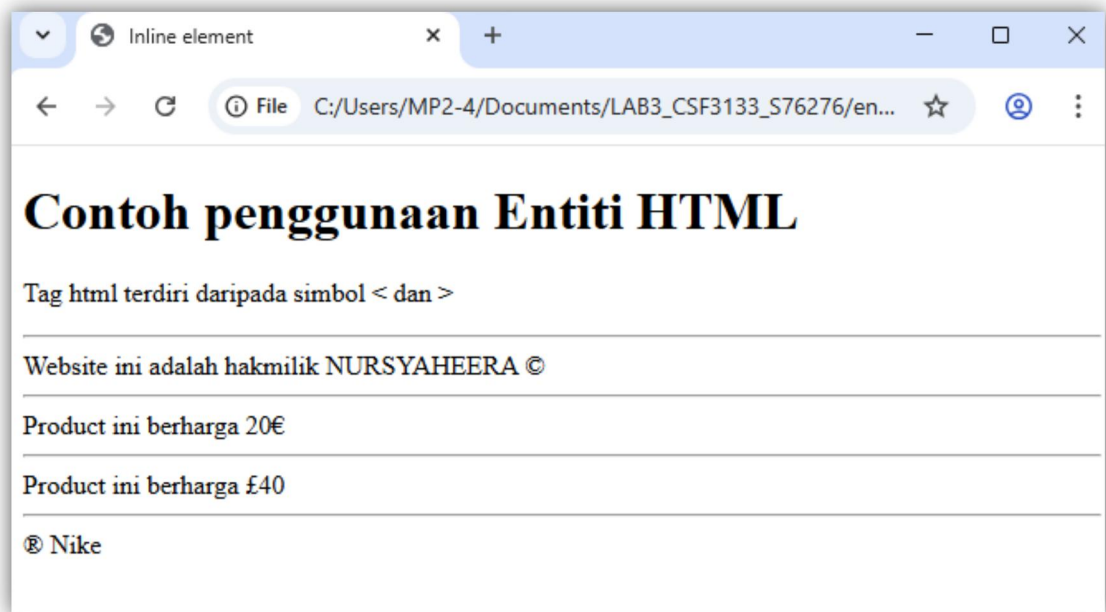

Output:

3.4 Understanding HTML Entities

1. File named entity.html was created.
2. Entities are used to display reserved symbols in HTML. For example, the symbols < and > are reserved symbols and we cannot write as follows so that the < sign is displayed on the browser. Other entities are used in this html.

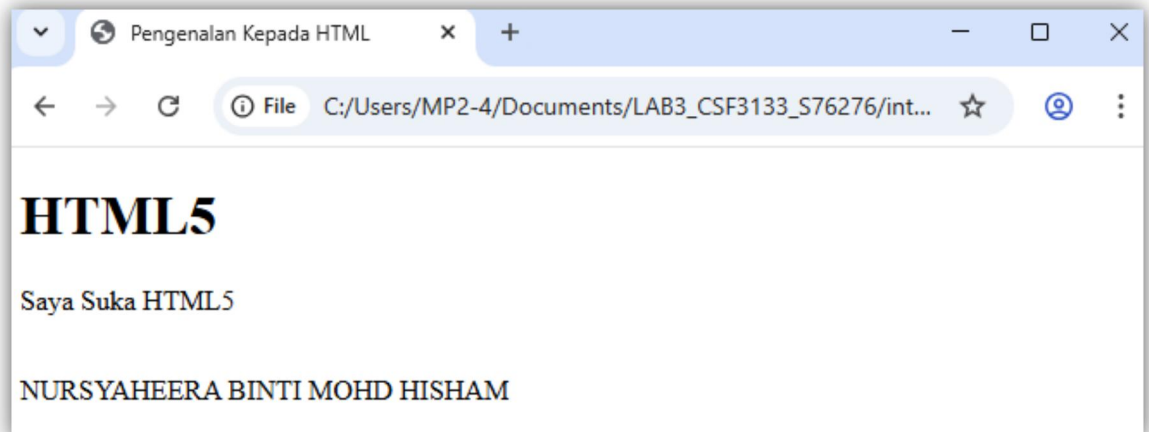

Output:

3.5 Hypertext Mark Up Language 5 (HTML5)

1. File names intro5.html was created.

Output:

2. file icon was double-clicked to view the output in a browser. While the browser gave the correct display on the screen, compliance with HTML5rules was then checked using the free W3C validation service at <http://validator.w3.org/>.

Set Google Chrome as your default browser and pin it to your taskbar

Set as default

Nu Html Checker

This tool is an ongoing experiment in better HTML checking, and its behavior remains subject to change

Showing results for uploaded file intro5.html (checked with vnu 25.11.4)

Checker Input

Show ☐ source ☐ outline ☐ image report [Options...](#)

Check by [file upload](#) [Choose File](#) No file chosen

Uploaded files with .xhtml or .xht extensions are parsed using the XML parser.

[Check](#)

Use the Message Filtering button below to hide/show particular messages, and to see total counts of errors and warnings.

Message Filtering

1. **Error** The character encoding was not declared. Proceeding using `windows-1252`.

2. **Error** Missing space before doctype name.

At line 1, column 10

`<!DOCTYPE><html><h`

3. **Error** Nameless doctype.

At line 1, column 10

`<!DOCTYPE><html><h`

4. **Error** Quirky doctype. Expected `<!DOCTYPE html>`.

From line 1, column 1; to line 1, column 10

`<!DOCTYPE><html>`

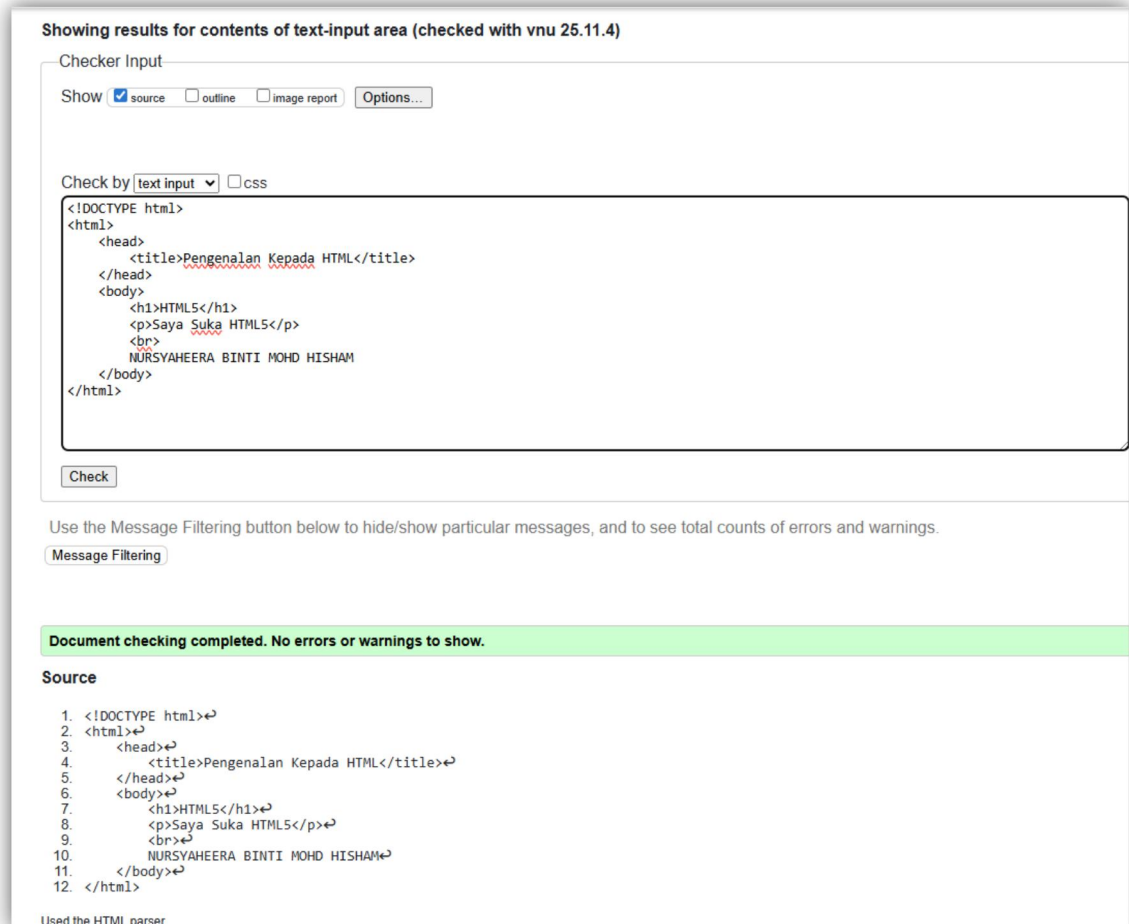

Document checking completed.

Used the HTML parser.

Total execution time 1 milliseconds.

3. The previous HTML code was fixed by replacing the existing, incorrect DOCTYPE with the <!DOCTYPE html>

Output:

3.6 Form Elements in HTML5

3.6.1 Input Elements in HTML5

1. new file named input5.html was created.
2. Test each of input fields by filling out the form that has been created. For the Website and Email space, used this:
 - a) Website: urlsay
 - b) Email: my email

Output:

A screenshot of a web browser displaying a form titled "input5.html". The browser's address bar shows the file path "C:/Users/MP2-4/Documents/LAB3_CSF3133_S76276/in...". The form contains several input fields: "Pilih warna kegemaran anda:" with a purple color picker; "Carian:" with the text "Happy Birthday"; "Tarikh:" with the date "05/11/2025"; "Masa:" with the time "12:24 PM"; "Bulan dan Tahun:" with "November, 2025"; "laman web:" with the text "urlsaya"; "Minggu:" with "Week 45, 2025"; and "Email:" with "my email". A "Hantar" button is at the bottom. A red dashed border highlights the "laman web:" field, and a tooltip with an exclamation mark icon and the text "Please enter a URL." points to it.

It cannot be read because it required the real address of URL.

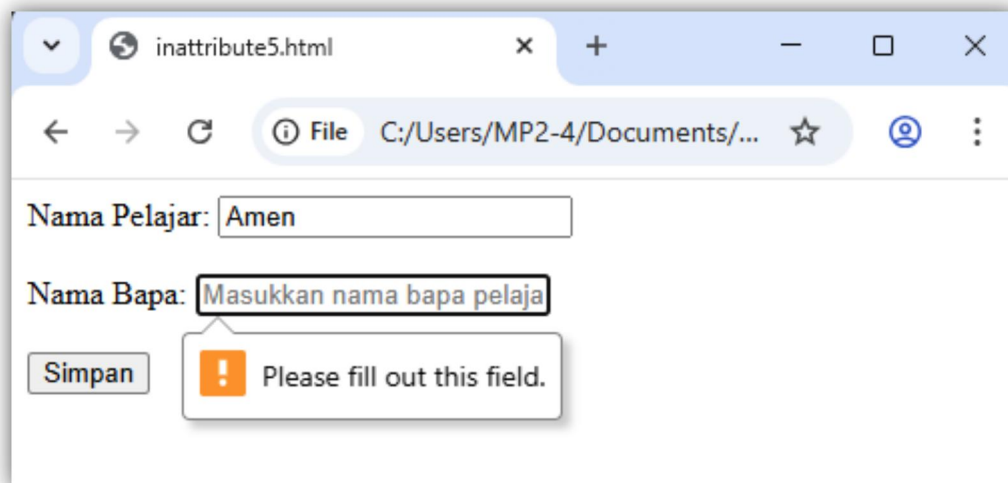

A screenshot of the same web form "input5.html" in the same browser. In this version, the "laman web:" field is empty, and the "Minggu:" field now shows "Week 45, 2025". The "Email:" field still contains "my email". A tooltip with an exclamation mark icon and the text "Please include an '@' in the email address. 'my email' is missing an '@'." points to the "Email:" field.

It cannot be read because it required an email in an email form.

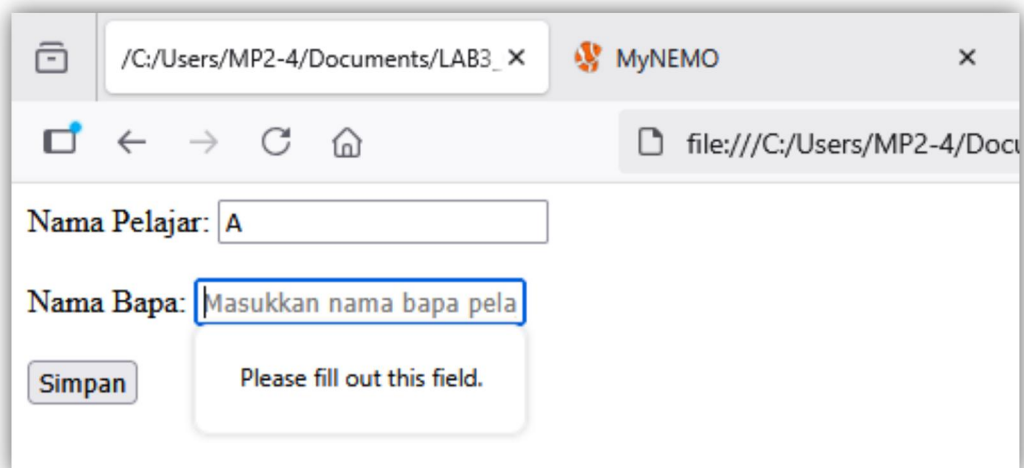

3.6.2 Attributes for Input HTML5

1. New file named inattribute5.html was created.
2. The output displayed and note the position of the cursor. Which text box has a flashing cursor? Fill in the 'Amen' value in the 'Student Name' box and leave it blank in the 'Father Name' column. Then, click on the 'Save' button.

Output:

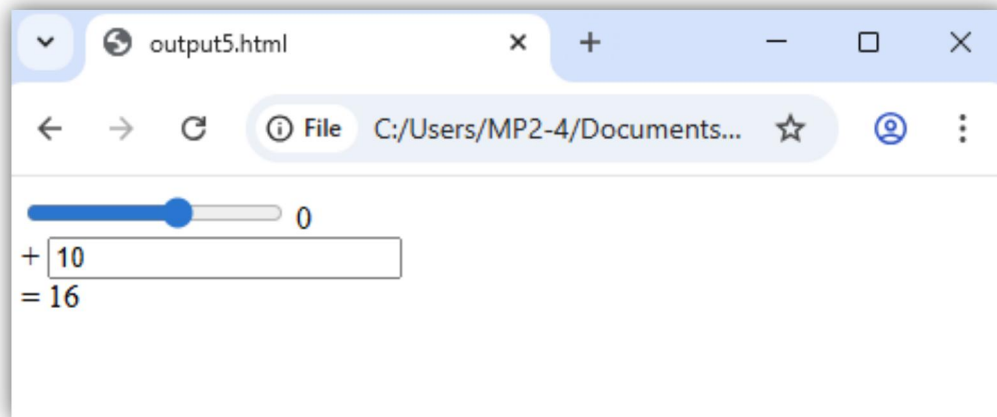

The browser will not submit the form. An error message will appear, prompting you to fill in the 'Father Name' field. This is because the required attribute is set on the input field for namaBapa.

The browser's autocomplete feature will suggest the previous entered value, 'Amen'. this is because the autocomplete attribute is set on the input field for namePelajar. Autocomplete works as expected.

3.6.3 HTML5 <output> element

Output:

3.7 Lab Exercise 3

3.7.1 Building an Interactive Contact Form with an Inline Calculator

1. Create the HTML File:

- a) Name the file lab3.html

2. Define the Structure:

- a) Organize the page using <div> elements
 - i. A header section for the website title.
 - ii. A content section containing the contact form and calculator
 - iii. A footer section with contact information.

3. Header Section:

- a) Inside a <div>, create a header that displays the title of the webpage using a block element like <h1>.
- b) Use inline elements, such as , within the header to add a slogan or subtitle

4. Content Section:

- a) Inside a second <div> create a contact form with HTML5 elements
 - i. Email input for user contact
 - ii. Date input for the user's preferred contact date.
 - iii. Range slider for user satisfaction level.
 - iv. Add a submit button

- b) Use a third <div> within the content section for an inline calculator
 - i. Provide two <input> fields where users can enter numbers.
 - ii. Use the <output> element to show the sum of the two numbers dynamically.

5. Footer Section:

- a) Inside a final <div>, create a footer section containing contact information
- b) Use an HTML entity, like ©, to display the copyright symbol.

Source Code HTML:

```
lab3.html X block.html div.html
lab3.html > html > body > div.container > div.contact > label
1 <!DOCTYPE html>
2 <html lang="en">
3 <head>
4 <meta charset="UTF-8">
